1. What is Full Stack Development?

- The process of developing a complete project end-to-end is called full stack development.
- An End-to-End means from the front-end screens to back-end database tables.
- Every Project has 3 parts :

- In every project, we have 2 kinds of operations
  - Development
  - After Development
- Under development, we will create database tables, UI Screens, programs for connecting UI Screens to Database tables and for performing this project operations.
- After development, we will performing compiling, building, deploying, running, testing project functionality and sharing source code to other developers of this project and finally sharing this project to client, having the calls with client and onsite team, finding bugs and testing performance etc.
- For easy understanding and learning, we divided full stack java into 5 modules
  - Java module
  - Database module
  - UI module
  - DevSecOps module
  - AWS basics
