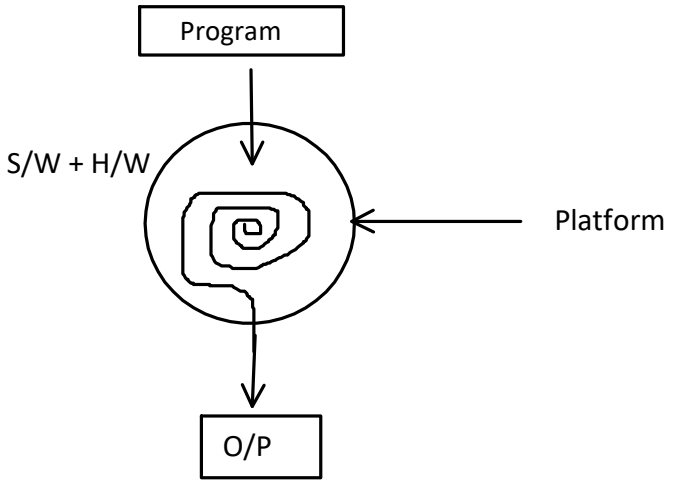
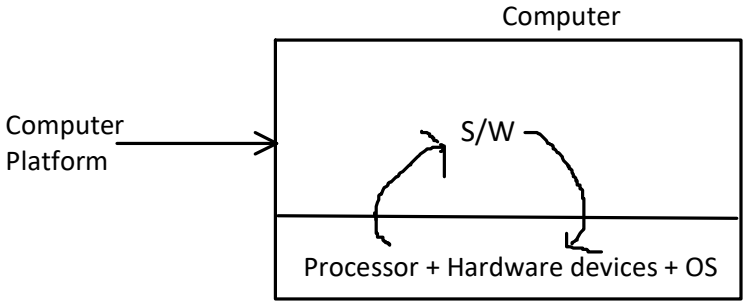
What is a platform ?

- A platform is an environment in which programs are loaded and executed and generate output.



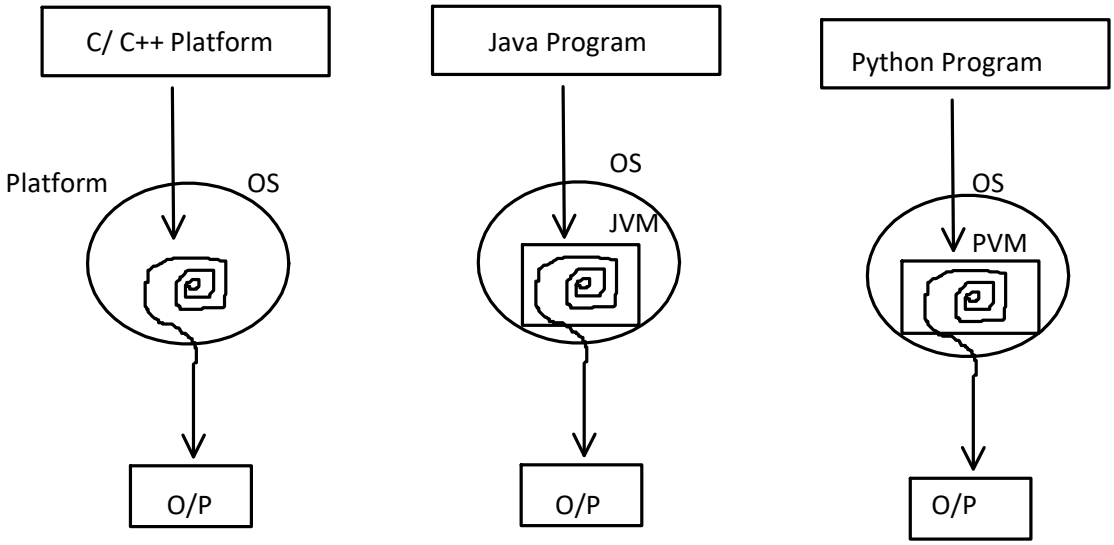
- A platform can be a software only platform or hardware only platform or both.
- A computer platform is
  Processor + Hardware devices + OS



- C and C++ program's platform is OS
  C and C++ programs are directly executed by OS.

- Java program's platform is JVM(Java virtual Machine)
  Java programs are executed by JVM, but not by OS
  JVM's platform is OS. That means OS executes JVM, JVM executes Java program.

- Python program's platform is PVM(Python Virtual Machine)
  Python programs are executed by PVM



- HTML page platform is browser
- Audio and video files platform is media player (VLC)

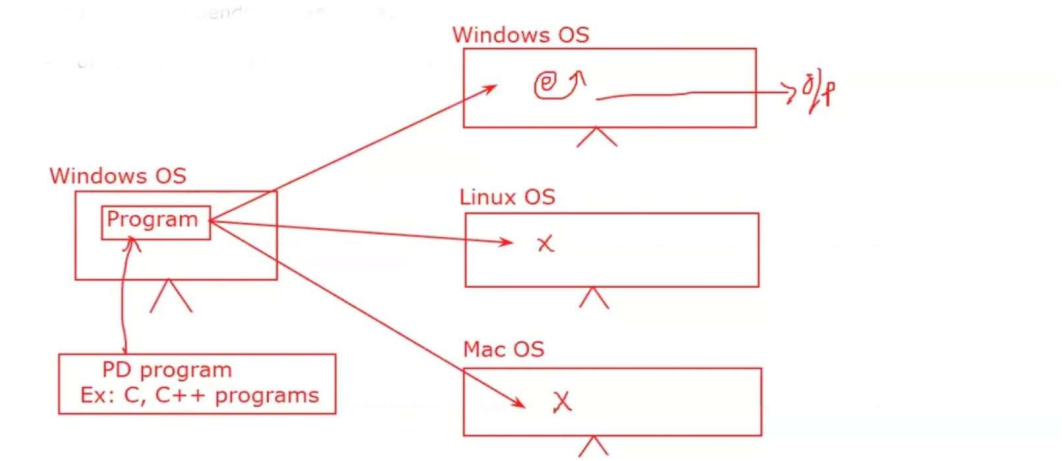
- .NET program platform is CLR (Common Language Runtime)

Platform Dependency

- A program's compiled code of one OS if it cannot be executed in different OS we call it as platform dependency.

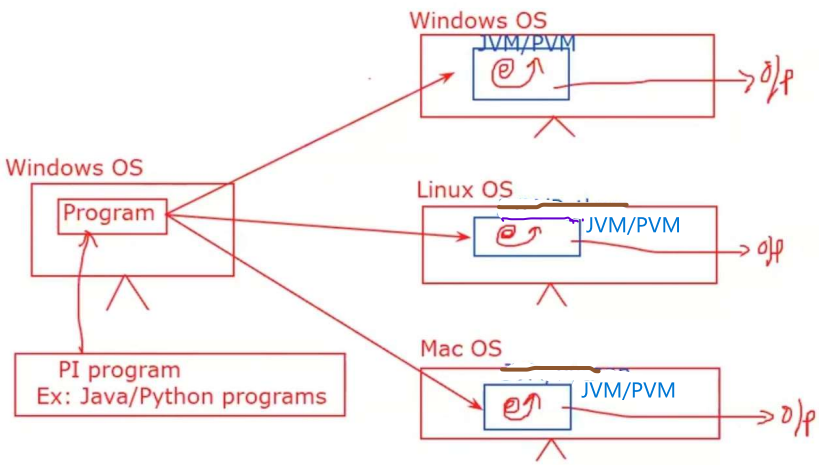
- The programming language using which we develop this program is called platform dependent language.

- For example: C and C++ programs



Platform Independency

- A program's compiled code of one OS if it can be executed in different OS we call it as platform independency.

- The programming language using which we develop this program is called platform independent language.


- For example : Java and Python programs
