Closely look at Hello World program

1. The words class, public, static and void are keywords. We must write them all letters lower case.
2. The words String and System are predefined class names. The first letter **S** must be capital letter.
3. In the class name FirstProgram the letter must be F and P must be capital, it is not a rule. It must not have spaces, it is a rule.
4. The name of class must convey the operation we are performing in this class, and the class name must be in Noun format.

Program #2: Develop a program to print your name on console

```
class NamePrinter{
	public static void main(String[] args){
		System.out.println("Debabrata Katual");
	}
}
```

Program 3#: Develop a program to print your name on console with stars as shown below

```
 ******************
 *  Debabrata Katual    *
 ******************
```

```
class NamePrinterWithStars{
	public static void main(String[] args){
		System.out.println(" ****************** ");
		System.out.println("* Debabrata Katual    *");
		System.out.println(" ****************** ");
	}
}
```

Program 4#: Develop a program to print your name in two lines

I/P:	**O/P:**
DebabrataKatual	**Debabrata** **Katual**

- In this program we must use the escape sequence character \n
- It represents new line

- The characters placed after \n are moved to next line on console

```
class NameInTwoLines{
	public static void main(String[] args){
		System.out.println("Debabrata\nKatual");
	}
}
```

Program #5: Develop a program to print your name in the below pattern

```
I/P:        O/P:
H           H
A               A
R                   R
I                       I
```

- In this program we must use the escape sequence character \t
- It inserts 8 or <8 spaces in places \t depending on number of characters available before \t

```
class NamePattern{
	public static void main(String[] args){
		System.out.println("H");
		System.out.println("\tA");
		System.out.println("\t\tR");
		System.out.println("\t\t\tI");
	}
}
```

```
class TPattern{
	public static void main(String[] args){
		System.out.println("12345678");
		System.out.println("\tHi");
		System.out.println("Hello\tHi");
		System.out.println("HelloHRU\tHi");
		System.out.println("HelloHRUWru\tHi");
	}
}
```

O/P:

```
12345678
        Hi
Hello   Hi
HelloHRU12345678Hi
HelloHRUWru1234 Hi
```

Program #6: Develop a program to print the same above pattern with single S.o.pl()

```
class NamePatternInSingleSopln{
	public static void main(String[] args){
		System.out.println("H\n\tA\n\t\tR\n\t\t\tI");
	}
}
```
